

Home Page

From an embedded notebook

```
from IPython.display import HTML
from matplotlib.animation import FuncAnimation

N_x = 101
N_px = 101

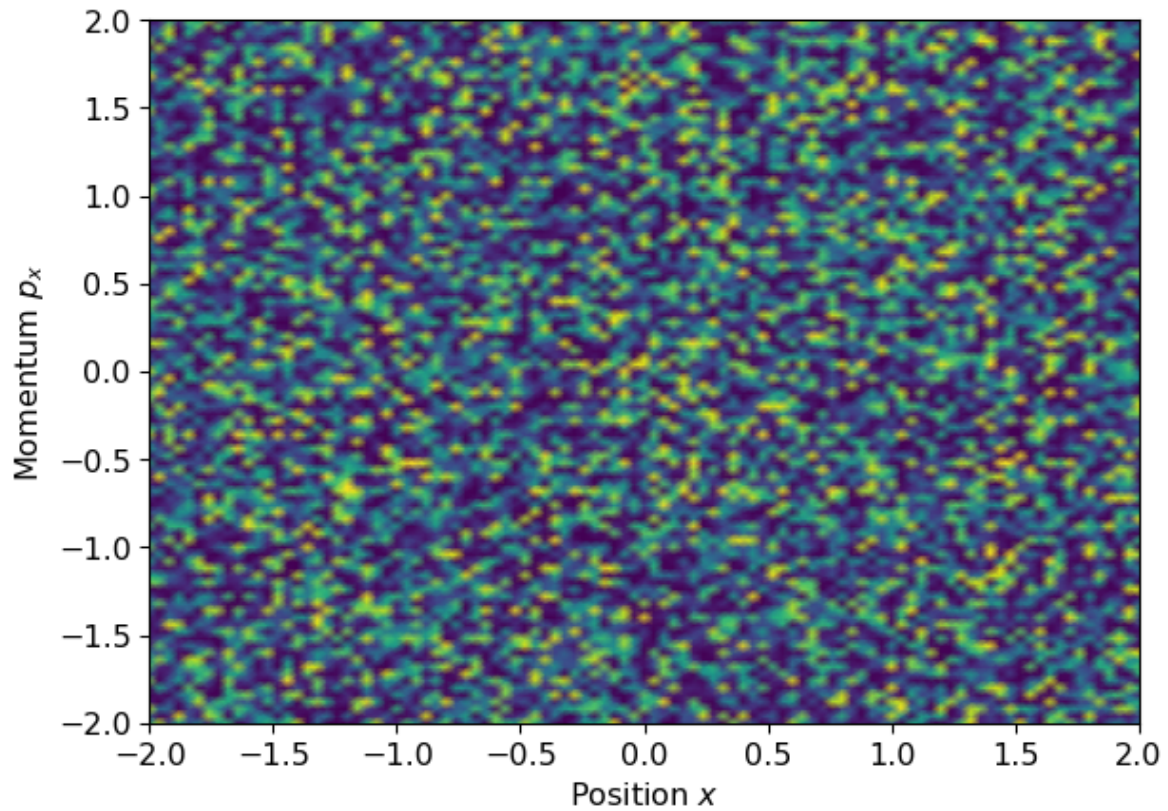

x_list = np.linspace(-2, 2, N_x)
px_list = np.linspace(-2, 2, N_px)
t_list = np.linspace(0, 2, 50000)

rho_t = np.random.rand(N_x, N_px)

fig, ax = plt.subplots()

img = ax.pcolormesh(x_list, px_list, rho_t**2, shading='gouraud', rasterized=True)
ax.set_xlabel("Position  $x$ ")
ax.set_ylabel("Momentum  $p_x$ ")

plt.show()
```

Still from an embedded notebook

```
fig, ax = plt.subplots()

img = ax.pcolormesh(x_list, px_list, rho_t**2, shading='gouraud', rasterized=True)
ax.set_xlabel("Position  $x$ ")
ax.set_ylabel("Momentum  $p_x$ ")

plt.show()
```
